

CalciumK2™

Bone Support Dietary Supplement

The lack of adequate amounts of calcium intake in today's lifestyle results in one of the highest rates of osteoporosis, in women particularly. As many as half of all women, and a quarter of men, over 50 may break or fracture a bone. Researchers have published in the American Medical Association Journal that, in July 2004, millions of Americans may have bone problems and don't know it.

Dietary calcium seems to be disappearing from the American diet due to mineral depletion of soils and food. A calcium supplement formulated for easy assimilation is important for healthy bone support. Sisel's answer for easy-to-assimilate calcium, magnesium and potassium (two of the other major minerals needed), is **CalciumK2**; a cutting-edge product that contains a mix of vitamins and bioavailable minerals and blend of three different calciums. This unique combination of important nutrients makes **CalciumK2** different from most other supplements.

Vitamin K2 supports the regulation of calcium in the bones and in the arteries, offering support to the skeletal and circulatory systems. Without adequate amounts of vitamin K2, calcium may not provide support for bones or arteries and other soft tissue.

To help calcium be absorbed by the bones, Vitamin K2 and Vitamin D3 initiate carboxylation. Carboxylation helps bones hold on to calcium and use it more efficiently.
